#### 1 Initial instructions

#### 1.1 Downloading expression file from GTEx

The first step to correctly generate all expression information from your initial coordinates is to download the GTEx\_Analysis\_2016-01-15\_v7\_RNASeQCv1.1.8\_gene\_median\_tpm.gct file from: https://gtexportal.org/home/datasets. Gene expression on the GTEx Portal are shown in Transcripts per Million (TPM), and the samples come from the 1000 genomes project. The downloaded file contains median gene counts (in TPM) by tissue (53 in total).

#### 1.2 General instructions to update input file

All R-scripts are in the first part of the document Scripts-TFM.R. However, the corresponding Dynamic report-TFM.Rmd can be used to generate the new set of output files automatically.

**IMPORTANT:** Fist read 'Dynamic report-TFM.pdf' for 'input file format'. Then, you need to copy your input document in the folder containing 'Dynamic report-TFM.Rmd' and indicate in the next lines your input CVS file name.

To change the **input file** you need to change the name of the .csv (NUMTs\_coord.csv) document in the beginning of this document:

```

# Dynamic Report - TFM $
                                                                                                 R Markdown
```

Figure 1: Screenshot instruction to change the name of the 'input file'. In the begining of the document you have the 'params' subsection, the 'file1:' corresponds to the 'input file' with the initial coordinates.

Now all the output files and all the information on Dynamic report-TFM documents will be generated with your new .csv data-table named NUMTs\_coord.csv.

**IMPORTANT:** Once you have done this first step, you can generate your new .html, which will have all data updated by pressing 'Knit' (See next figure). Maybe this will take more than an hour.

The following pages will be generated with the new information. Now you have all data, statistics and tables updated with the coordinates in document NUMTs coord.csv.

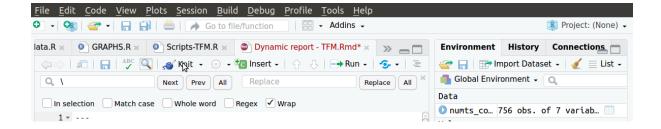

Figure 2: Screenshot instruction for generate the new .html file. In RStudio, by using R Markdown, we can generate the corresponding .html file by pression 'Knit' (in the upper-left part of the first square in RStudio).

#### 2 Context

The following scripts were generated for the final master's project in Bioinformatics and Biostatistics (*Universitat Oberta de Catalunya*) entitle **Are Nuclear Insertions of Mitochondrial Origin Pseudogenes?**.

This Master's project focussed on the study of Nuclear mitochondrial DNA sequences (NUMTs). NUMTs are the result of a continuous DNA transfer from mitochondria to the nucleus (Boogaart, Samallo, and Agsteribbe 1982; Tsuzuki et al. 1983).

In 2011, in a published work led by Dr Cristina Santos, it was identified 755 NUMTs in the human genome (Ramos et al. 2011). They compared the human mtDNA (NC\_012920) against human genome (GRCh37/hg19 assembly), and they described different aspects of this comparisons: frequency, distribution and size of NUMTs for each chromosome; % identity between NUMTs and mtDNA sequence... Based on this information and **NUMTs coordinates**, in the present master's final project, we want to clarify whether or not these NUMTs origin pseudogenes.

The present dynamic report generates a set of intermediate (.txt documents) and a final file called **FINAL\_OUTPUT\_TABLE.txt** with all relevant genetic content and with a more in-depth expression and gene ontology study in the genes encoded in this NUMTs. Additionally, we also perform a small conservation study of these regions in the genome of other primates. By changing the **input document**, and following the next instruction, it is possible to generate a new set of intermediate and final documents with the new outputs.

### 3 Visualization of NUMTs in UCSC genome browser

First of all, with the NUMTs coordinates publically available by Ramos et al. (2011), we created the file bed\_NUMTs-ID.txt, which can be uploaded to *UCSC genome browser* -> custom track to visualise our NUMTs.

The bed\_NUMTs-ID.txt also include the corresponding mitochondrial regions for each NUMT, with the same NUMT ID by adding "mt" in the beginning.

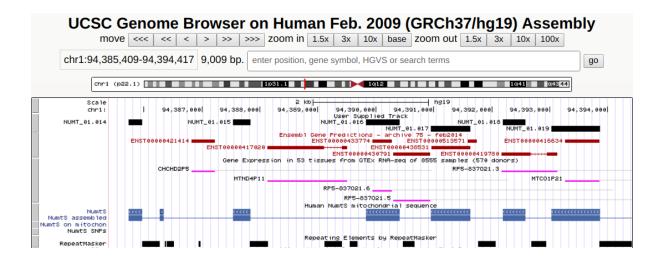

Figure 3: Custom Track NUMNTs visualization in UCSC Genome Browser. The first track on the picture is our Custom Track from the document "bed\_NUMTsID.txt".

#### 4 Installing only packages we need

Depending on the computer and session, we already have some R packages installed. To install only the ones we need we will use the following script:

However, to generate our data, we also need to download special packages from Bioconductor:

IMPORTANT: If you cannot install Bioconductor's biomaRt package by using 'biocLite("biomaRt")', in Linux, if you have administrative privileges, you can write in the command line: 'sudo apt-get install r-bioc-biomart' to install it.

### 5 Input file format

The document must be .csv with comma (",") separator, which is the one automatically used in most programmes like Excel or LibreOffice Calc when we save the data as .csv. The first line of the document will be the Column names. The First column will name as id (with any ID you wanted to use), second column chr (with the number of the corresponding chromosome), third start\_n with the starting bp coordinate and then end\_n with the end pb coordinate. The last three columns will be additional information. In the case of the original document created for this final master's project corresponds to the coordinates mapping these regions in the mitochondrial: 6th column entitle mt and in all cases "mt" because is how mitochondrial DNA is recognised, and then both, initial start\_mt and final end\_mt coordinates in the mitochondrial DNA.

```
##

                       9634687
                                9634887 mt
                                                 907
                                                       1117
## 6 NUMT_01.006
                    1 11202904 11202975 mt
                                               12293
                                                      12358
```

The file NUMTs coord.csv contains a total of 756 rows with coordinates.

#### 6 All intermediate files and the final table

#### 6.1 File 1 and 2: "All attributes.txt" & "All filters.txt"

To download the list of genes within our initial coordinates and its associated phenotype description, gene ontology (GO) and conservation in other species, we use biomaRt package from Bioconductor:

#### 6.1.1 The biomaRt package

```
##
## To cite the biomaRt package in publications use:
##

     and Wolfgang Huber, Bioinformatics 21, 3439-3440 (2005).
##
##
## To see these entries in BibTeX format, use 'print(<citation>,
## bibtex=TRUE)', 'toBibtex(.)', or set
## 'options(citation.bibtex.max=999)'.
```

#### 6.1.2 Preparing Package 'biomaRt'

We set up the dataset we will use, specifically, ensembl\_MART\_ensembl, which is working with the version:

It is automatically generated the first two files: All\_attributes.txt (with all attributes you can download with biomaRt package) and All\_filters.txt (with all filters to select the information to use from your input file).

The dimensions of File 1 are: 1416, 3 and the dimensions of File 2: 303, 2

#### 6.2 File 3: "gene\_results.txt"

Filtering by our initial coordinates, we create the file gene\_results.txt with all genes which coordinates and our initial coordinates overlaps partially or totally.

```

```

The dimensions of File 3 are: 1155, 9

In total, gene\_results.txt contains 733 genes and 241/756 NUMTs do not overlap with any gene.

#### 6.3 File 4 and 5: "up gene results.txt" and "down gene results.txt"

Genes in gene\_results.txt also includes large gene coding proteins where the NUMTs are probably located in intronic regions. To eliminate this genes, an additional two other lists were generated with new coordinates obtained from the upstream or downstream part of the original NUMTs coordinates (between 100 - 1000 bp from the initial coordinates). Once we get this two new list of genes associated to different NUMTs, we eliminate from the initial list in gene\_results.txt that genes also present upstream AND downstream the initial coordinates. However, we ALWAYS associated gene with NUMTs, and also those genes associated to specific NUMT is eliminate (to conserve genes which includes more than one NUMT).

```

In the upstream part of NUMTs coordinates we find 414 and in the downstream region 425 genes. Once we have the three list of genes, we wanted to compare all of them and select the ones originated by a NUMT insertion.

The dimensions of File 4 are: 891, 9 and the dimensions of File 5: 905, 9

#### File 6: "genes.txt" 6.4

The distribution of the genes within NUMTs in the different chromosomes is:

```
1 10 11 12 13 14 15 16 17 18 19 2 20 21 22 3 4 5
                                                   6
## 45 16 14 4 8 5 9 13 18 2 3 81 5 4 8 24 36 32 16 39 19 23 28
```

Of the 733 initial genes, after our filtering, we have 457 genes within the initial input coordinates.

The dimensions of File 6 are: 457, 1

#### 6.5File 7: "go results.txt"

```

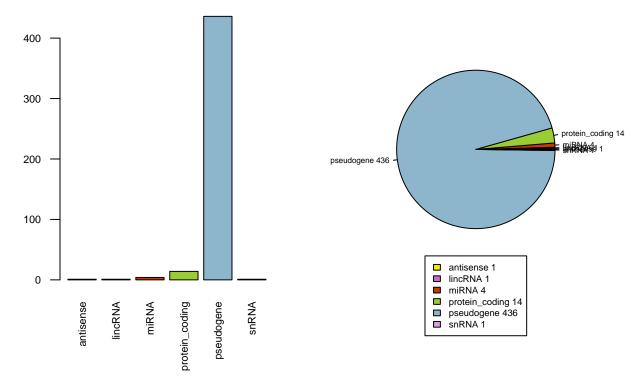

Figure 5: Gene biotype annotated for our list of genes.

For the 457 whithin our NUMTs, 457

In this case, all genes within our NUMTs are classified in ensembl-Biotype

The dimensions of File 8 are: 457, 5

#### 6.7 File 9: "mean\_tpm\_GTEx.txt"

We then search in GTEx\_Analysis\_2016-01-15\_v7\_RNASeQCv1.1.8\_gene\_median\_tpm.gct document our list of genes included in genes.txt.

Initially, we save all data existing for all our genes and calculate the mean and total TGM per gene.

The dimensions of File 9 are: 453, 58

#### 6.8 File 10: "subset\_expressed.txt"

In nrow(mean\_tpm\_GTEx).txt document, for the 457 within our initial coordinates, 453 have expression data in GTEx Portal. However, some of them are not expressed in any tissue. To subset the expressed genes, we will create an additional table containing genes with > 0.5 TMP in at least, one tissue:

The dimensions of File 10 are: 73, 58

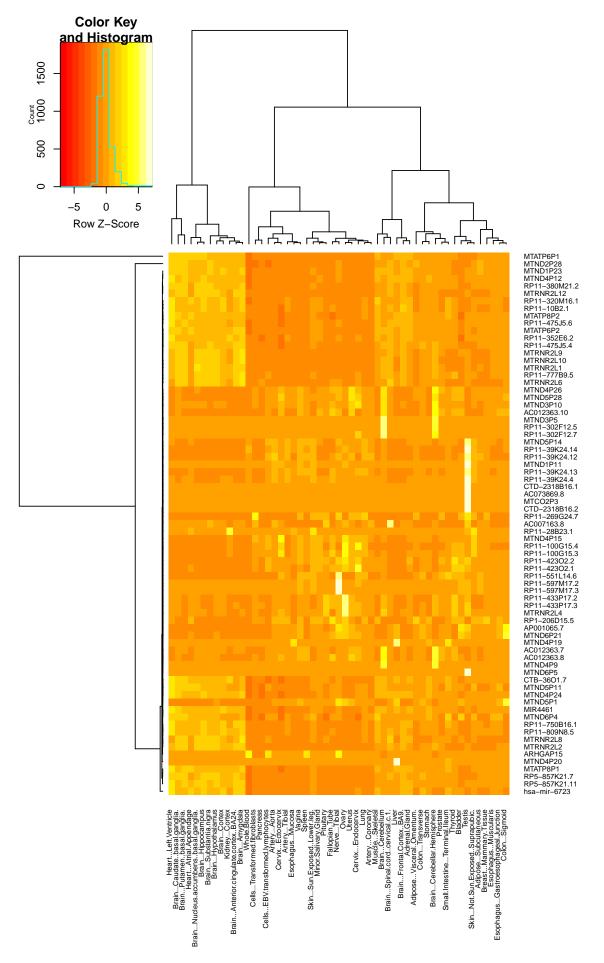

Figure 6: Heatmap of all expressed genes normalized by row (to see the different expression profile of each gene for the different tissues).  $^{15}$ 

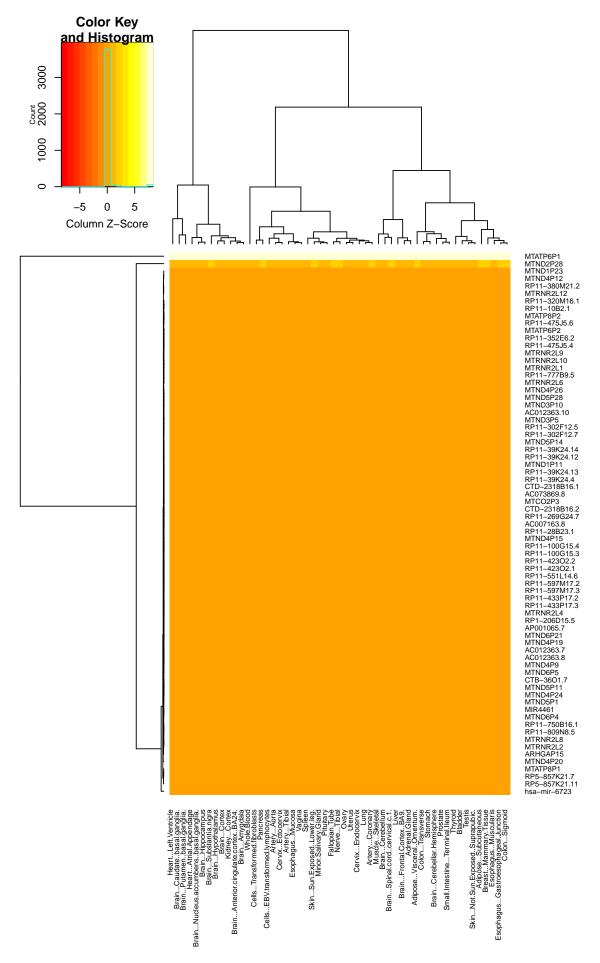

Figure 7: Heatmap of all expressed genes normalized by column (to see the different expression profile of the different gene for each tissue).  $^{16}$ 

#### **TPM/Tissue**

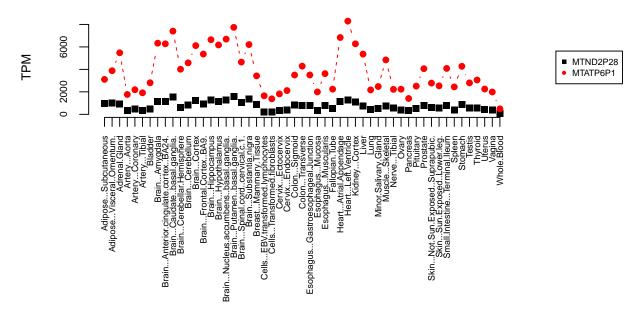

Figure 8: Graphical representation: expression profile of hight expressed genes (>=1000 TMP).

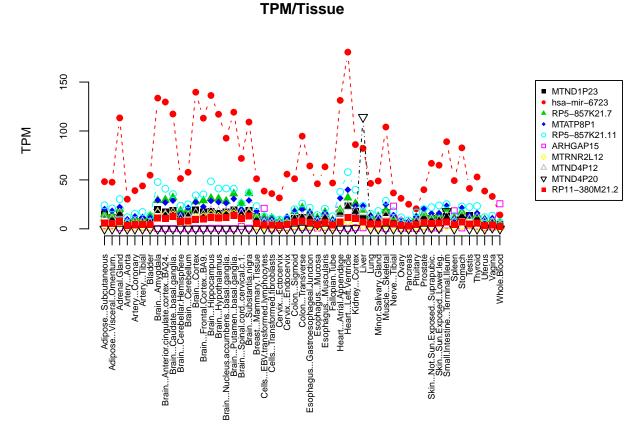

Figure 9: Graphical representation: expression profile of medium expressed genes (between 10 and 1000 TMP).

Of the 453 of our set of genes included in GTEx Portal, 73 are expressed in at least, one tissue (with  $\geq$  0.5 TPM). But the EMBL-EBI Expression Atlas classified genes in: - low expressed (between 0.5 and 10 TPM), - medium expressed ( $\geq$ 10 to 1000 TPM) and - high expressed (more than 1000 TPM).

#### 6.9 File 11: "FINAL OUTPUT TABLE.txt"

Finally, the final table FINAL\_OUTPUT\_TABLE.txt will include relevant information from all the analysis perform in this Dynamic Report. The first 6 lines of our finall document will be:

The dimensions of File 11 are: 1032, 76
